

Entropion – In turning of the eye lid

In the normal position the eye lid position is such that the eye lashes curl outwards so they do not touch the eye.

An Entropion is where the eye lid turns inwards and the eye lashes begin to touch the cornea.

An entropion needs to be corrected as when the eye lashes touch the eye, it usually becomes watery, uncomfortable, red and prone to infection.

It is usually an ageing problem with laxity of the ligaments and muscles, hence tends to occur only in the retired population. However Viith nerve or Facial palsies are also a cause.

There are various minor operations to correct the eye lid turning inwards.

Mr. Nicholas Lee 2012
