

Laser Treatment for Floaters

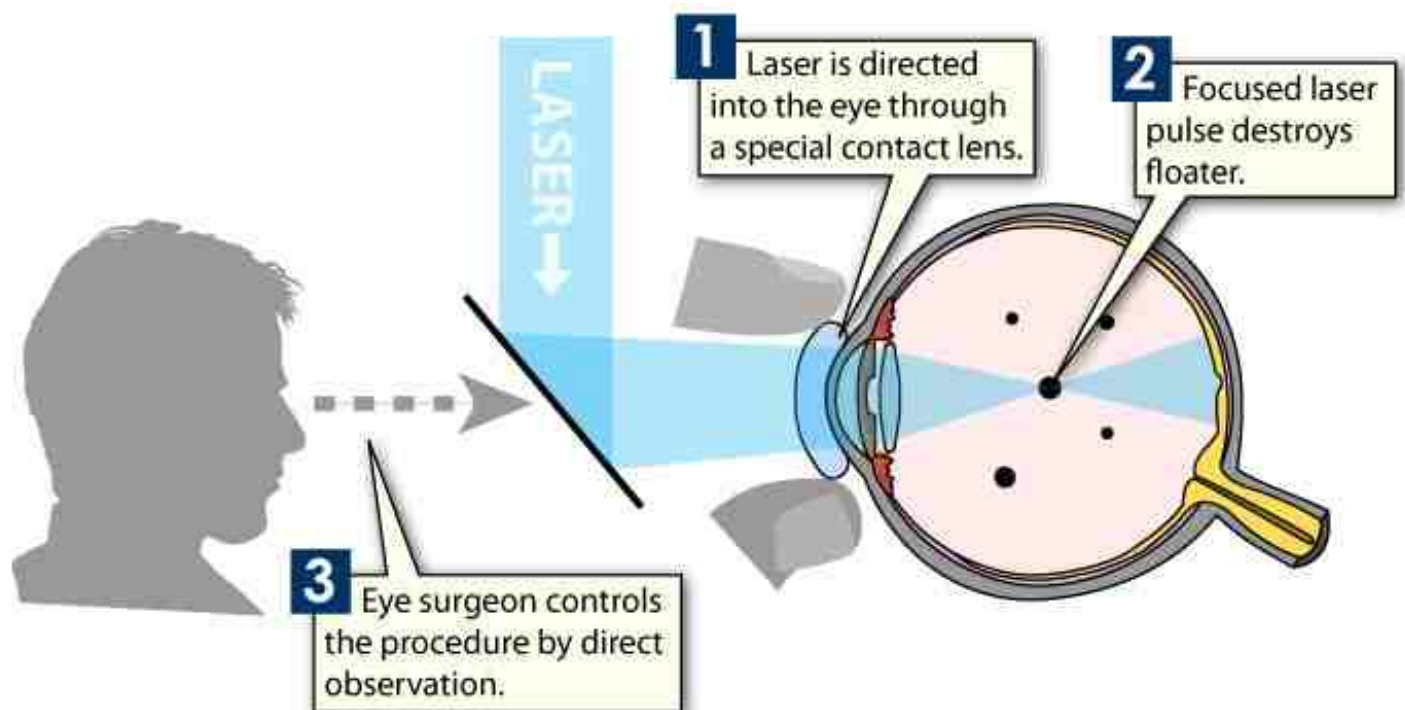

Until recently patients were told to ignore floaters, but clearly many patients find them unacceptable. In the last few years the YAG Laser Vitreolysis procedure has become a popular treatment for persistent floaters, and all patients treated by Mr Moriarty so far have been highly delighted with the outcome.

The procedure takes a few minutes and can be done in Mr Moriarty's office. There is no discomfort during or after the procedure. If you are bothered by persistent floaters, then you should be assessed to see whether laser treatment can help you.

How does the laser work?

The laser beam is reflected via a lens into the vitreous floater, and vaporises it by vitreolysis.

Any other strands are also lasered, and the eye surgeon monitors the procedure throughout under direct vision.

Appointments

To make an appointment or refer a patient to Mr Moriarty, please [book online](#) or contact **Deryn Fawcett**:
